

Maestro/JR Workstation Software
Version 1.9.1 Licensing Supplement
(Use this document with the enclosed Installation Instructions)

Introduction

The Maestro/JR Workstation Software provides a bridge from your CAD files to the SLA. Maestro/JR provides the ability to prepare CAD-generated .stl or .slc files for part building on the SLA. This document explains the differences between Maestro/JR and Maestro, and explains the differences in the licensing procedure between Maestro/JR 1.9.1 and the previous Maestro/JR versions.

Maestro/JR Functionality

Maestro/JR 1.9.1 is a full functioning sub-set of Maestro 1.9.1 combining the Part Manager™, View™, ZSlice™, and Converge™ modules from the full Maestro product. Version 1.9.1 is available for both the SGI and HP workstation platforms. What is not included in Maestro/JR from the full version of Maestro is the 3dverify™, an .stl file analysis and fix module, and Vista™, a support generation and editing module. The functionality of these latter two modules is available on other third-party software packages, or can be added to your version of Maestro/JR. Contact your 3D Systems sales person for details on purchasing the 3dverify and Vista modules.

Maestro/JR Licensing Procedure

Unlike past versions of Maestro/JR which required individual licensing of each module, the Maestro/JR modules are licensed in the same way as described for the full product. Follow the directions in the Installation Instructions to install the software. After completing the Installation procedure, immediately continue with the License procedure to receive your Passkey for the Maestro/JR product.
